Chemical Air Treatment by Atomization

**The “Cold-Fogging” method treats
porous and non-porous surfaces
as well as the interior air...**

Our product is an EPA registered hospital grade disinfectant & sanitizer, and our process of “Cold-Fogging” by atomization completely eliminates airborne contaminants while sanitizing porous and non-porous surfaces. The product dissipates quickly and surfaces do not require rinsing afterwards.

No more closing the building or being chased out of your house for days at a time, no more hand wiping every surface, nook, & cranny. Our application is quick and easy and our process can completely sanitize and decontaminate an entire house or building in just a few hours and be reopened for business with a savings of over 70% of conventional cleaning costs.

Our services are in demand at school, doctors offices, churches, in-door playground facilities, and residential dwellings associated with the sick home syndrome or any interior or public facility needing surface and air sanitizing. Our crews are on call and standing by especially during the Swine Flu epidemic and MRSA Staph infection outbreaks.

There is a simple, yet effective solution for viral and bacterial decontamination. Call today for more information or a “FREE” DVD demonstration!
