

## Working In The Attic

Sending a crew in to an attic may be the most dangerous remediation job there is.

On top of the confined space, small access, low head room, lack of flooring, and uncomfortable seating there is always the open wiring and electrical hazards, the knee deep insulation, the high heat, and lack of breathable air. Oh! did I forget to mention the small animals nesting in the attic that do not like visitors, or the bird droppings and rat feces. Of course none of that compares to finding Batts in the attic...good times!

To the homeowner, the mold growth may not appear to be extensive and the clean up process easy...but add in all of these fun and exciting features and you'll start to understand why attic remediation jobs tend to be a little more costly.

The protection and safety of the mold technician must be our main goal second only to properly treating the entire attic -- not just what you can see!
